

ABSTRACT

My Waypoints

This project aims to create a distributed web application to augment the information about the travel routes, that is provided by typical map applications. The web application will augment the travel route information by displaying weather at the starting point and the destination as well as, at the towns and cities along the route. Finally, the route and the weather details will be displayed in a user friendly way.

The application stack for the project would be: The client side would use HTML5 and css, the server side would use Apache HTTP server (Xampp/php) and Database would be MySQL. The google maps service API and whether service API would be used for providing maps and weather data to My Waypoints server.

System Model for My Waypoints Application
